

- 1(a)(i) Brittleness is the ability to break suddenly/easily when a force is applied ✓ (1)
- (ii) Elasticity is the ability of a material to return to its original shape and size when a deforming force is removed ✓ (1)
- (b) The extension is proportional to the force causing it provided the limit of proportionality/elastic limit, is not exceeded. ✓ (1)
- (c)(i) Metal X ✓ has a bigger slope of the linear part of the graph ✓ (Bigger stress/strain ratio) (2)
- (ii) Metal X ✓ The plastic region of graph X is greater than that for graph Y ✓ (2)
- (iii) Metal X ✓ X can withstand greater stress before it breaks ✓ (2)
- (d) (i) P ✓ Since IT has a larger area of cross section ✓ (2)
- (ii) Q ✓ Since it will have a longer extension for a given load ✓ (2)

(e)

$$BC = \sqrt{2^2 + 1.5^2} = 2.5 \text{ m} \checkmark$$

$$\text{Extension} = 2 \times 2.5 - 4 = 1.0 \text{ m} \checkmark$$

$$\cos \theta = 1.5/2.5 = 0.6$$

$$2T \cos \theta = mg \Rightarrow m = 1.2T/g \checkmark$$

$$T = EAl = 1.2 \times 10^{11} \times (1 \times 10^{-3} \times 10^{-6}) \times 1 = 30 \text{ N}$$

$$\therefore m = (1.2 \times 30) / 9.81 = 3.67 \text{ kg} \checkmark \quad (4)$$

(f) Water acquires a velocity ✓ (Velocity of efflux) as it moves out. It has a forward momentum ✓ so the tank should acquire an equal and backward momentum ✓ in the same time hence the backward force ✓

marginQn 2 (CONT)

is directly proportional to the applied force and takes place in the direction of the force.
 e.g. water jet falling on the ground O2 eventually digs a hole.

* Action and reaction are equal but opposite

e.g. a book placed on top of a table (any two) keeps on top of it.

(b) i) When two or more bodies collide, their total linear momentum is conserved provided no external force acts on them. of

$$u, m_1 u_1 = m_1 v_1 + m_2 v_2$$

$$u_1 = v_1 + \alpha v_2$$

$$v_2 = \frac{u_1 - v_1}{\alpha}$$

$$\frac{1}{2} m_1 u^2 = \frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2$$

$$u_1^2 = v_1^2 + \alpha v_2^2$$

$$v_2^2 = \frac{u_1^2 - v_1^2}{\alpha}$$

$$\therefore \frac{(u_1 - v_1)^2}{\alpha} = \frac{u_1^2 - v_1^2}{\alpha}$$

$$u_1 - v_1 = \alpha (u_1 + v_1)$$

$$u_1(1-\alpha) = v_1(1+\alpha)$$

$$\therefore u_1 = \frac{(1+\alpha) v_1}{(1-\alpha)}$$

(3)

(a) (i) It states:- For a non-viscous, incompressible fluid undergoing steady flow the sum of pressure, kinetic energy per a unit volume and potential energy per a unit volume is always constant at any point along a stream line ✓ (1)

(ii)

From the diagram above air layers on top move at a high velocity hence a low pressure being exerted, then air layers below move at a low velocity hence a high pressure is being exerted. The pressure difference causes a lift. ✓ (3)

$$(b)(i) P_1 - P_2 = \frac{1}{2} \rho (V_2^2 - V_1^2) \checkmark = \frac{1}{2} \times 1.2 (135^2 - 120^2) \\ \approx 2.295 \times 10^3 \text{ Nm}^{-2} \checkmark \quad (2)$$

$$(ii) \text{ Lift force} = (P_1 - P_2) \text{ Area} \checkmark = 2.295 \times 10^3 \times 2.8 \\ = 6.426 \times 10^4 \text{ N} \checkmark \quad (2)$$

(c) (i) It is a type of fluid flow during which fluid particles at equal distance from the axis of flow move with the same velocity parallel to the axis of flow. ✓ (2)

(ii)

From the diagram above, if P_1 and P_2 are the pressures and V_1 , V_2 are the velocities of the fluid at L and M on the same horizontal level, then from Bernoulli's

equation we have, $P_1 + \frac{1}{2} \rho V_1^2 = P_2 + \frac{1}{2} \rho V_2^2$, since $h_1 = h_2$, therefore, $P_1 - P_2 = \frac{1}{2} \rho (V_2^2 - V_1^2)$

Now if A_1 and A_2 are the cross-sectional areas at L and M, then $A_1 V_1 = A_2 V_2$, hence $P_1 - P_2 = \frac{1}{2} \rho \left(\frac{A_1^2}{A_2^2} - 1\right) V_1^2$. V_1 can be got from the expression above.

OR → Treat the Pitot-Static tube.

(Q8)

8(i) Ions from source S are directed through slits S_1 and S_2 into the velocity selector having electric field of intensity E and magnetic field of intensity E/B_1 . Only ions of charge Q pass through slit S_3 undeflected with a velocity $v = \frac{EB_1}{Q}$. The ions enter the deflection chamber having a uniform magnetic field of flux density B_2 . The ions move along a circular path of radius r and strike the photographic plate at point P. The centripetal force is provided by the magnetic field, $B_2 Q v = \frac{mv^2}{r}$

$$\frac{Qv}{m} = \frac{E}{B_1} \Rightarrow \frac{Q}{m} = \frac{E}{B_1 B_2 r}$$

(ii) Abundant isotopes carry more energy. ✓
On striking the photographic plate, more photographic emulsions evaporate. ✓
The corresponding line (point) appears sharper ✓

$$8C \quad i) \quad q_2 e v = 1.8 \times 10^{-11} \times 400 = 1.8 \times 10^{-15} \text{ C} \cdot \text{m/s}$$

$$md = 4 \times 10^{-2} \text{ m}$$

$$x = \frac{1.8 \times 10^{-15}}{(4 \times 10^{-2})^2} = 4.5 \times 10^{-13} \text{ m}$$

$$y = L \sin^2 \theta = 0.0225 \text{ m}$$

(9) (a) It is the emission of electrons by a heated metal surface. ✓ (1)

(ii) When V_a is small the electrons emitted by the filament crowd round it and form a space charge, since their emission speeds are small. A very small anode current I_a passes at this stage due to the few electrons that are emitted with sufficient speeds to reach the anode. When V_a is increased more of the electrons reach the anode and I_a rises. And when V_a is sufficiently large all the electrons emitted per second reach the anode and I_a has its saturation value. Along CD further increase in V_a has little effect on I_a . ✓ (5)

The cathode is heated by the heater and it emits electrons heated thermionically. Then the grid controls the number of electrons striking the screen per second or the brightness on the screen. The anodes accelerates and focuses the electrons into a fine beam. Then the Y-plates deflect the electron beam vertically and the X-plates deflect the beam horizontally. The screen displays the formation of the trace (it glows). (3)

(iii) The time base circuit applies a saw-tooth voltage to the X-plates that causes (sweeps) the spot to travel across the screen from left to right at a steady speed. And the spot is made to return to left rapidly as it falls to zero. If a voltage is now applied to the Y-plates, the variation of the voltage with time is now displayed on the screen. (2)

An alternating p.d appears across AB. In a half cycle when A is positive relative to B only diode X conducts and current flows along AX RC. Then during the other half cycle when now B is positive relative to A only diode Y conducts and the current flows along BYRC. Whereby the current flows in the same direction in both half cycles as shown in the diagram above. (3)

QUESTION 10

- a) Photoelectric emission is instantaneous ✓
 for every metal surface, there is a minimum frequency 2
 below which no electrons are emitted. ✓
 Kinetic energy of the photoelectrons ranges from Any 2
 zero upto a maximum and the maximum
 K.E is directly proportional to the frequency of
 the incident radiation.

Photocurrent is directly proportional to the
 intensity of incident radiation

- b) Readily available ✓
 Virtually inexhaustable supply of fuel ✓
 None of the toxic and highly radioactive wastes 3
 are associated with fusion ✓
 gives a greater energy yield per kg of fuel used
 ii) High temperatures are needed to provide the
 nuclei with energy needed to overcome the
 repulsion forces between the protons of the atoms. ✓

c) Number of neutrons = $227 - 87 = 140$ ✓
 Mass of 87 protons = 87×1.0073 u = 87.6351 u
 Mass of 140 neutrons = 140×1.0087 u = 141.218 u
 Total mass of nucleons = $87.6351 + 141.218$ 5
 $= 228.8531$ u ✓

Difference in mass = $228.8531 - 223.0198$ u ✓
 $= 5.8333$ u ✓

- ii) The total mass of all the nucleons is greater
 than the mass of the nucleus! The difference
 in mass is the measure of the binding energy
 of the nucleus. ✓

QN 10 CONT'D

i) Locate bone fractures ✓ Kill cancer cells ✓ Any 3
check for cracks and flaws in metals ✓ study of crystal structure, security checks at air port.

ii) Light of frequency, f has particles called photons each of energy, $E = hf$. When light falls on a metal surface each photon interacts with only one electron giving it all or none of its energy. If the energy is equal to or greater than the work function, the photon is absorbed and an electron is emitted without a time lag.

This explains the instantaneous nature of the photoelectric emission. ✗

If the energy of the photon is less than the work function, all of it is rejected and no emission of electrons occurs. ✗ This accounts for the existence of the threshold frequency, f_0 .

Increase in intensity of the incident radiation increases the number of photons and more electrons are emitted per second. ✗ Thus photocurrent is proportional to the intensity. ✗

Increase in frequency of incident radiation increases the energy of the photons therefore the photoelectrons have greater maximum K.E. ✗

This explains the fact that Frequency of the incident radiation is directly proportional to the maximum K.E. of the photoelectrons. ✗

TOTAL: 20
